This program receives federal financial assistance from the U.S. Fish and Wildlife Service and prohibits discrimination on the basis of race, color, national origin, age, gender, or disability. If you believe that you have been discriminated against as described above in any program, activity, or facility, or if you desire further information, please contact PSMFC Human Resources, 205 SE Spokane Street, Portland, OR 97202 or write Office for Human Resources, U.S. Fish and Wildlife Service, Department of the Interior, Washington, D.C. 20240.

## Acknowledgments

The success of the Idaho Anadromous Fish-Marking Program is contingent upon the cooperative efforts of many agencies including Idaho Department of Fish and Game (IDFG), United States Fish and Wildlife Service (USFWS), Pacific States Marine Fisheries Commission (PSMFC), Lower Snake River Compensation Plan (LSRCP), and Idaho Power Company (IPC). It was due to the hard work, collaboration, and dedication of this group that the 2015 marking season was successfully completed. Funding for this program is provided by the USFWS through the LSRCP and the IPC.

Many individuals deserve recognition and thanks for their dedication to the marking program; without their efforts the success of this program would not have been possible. I would like to thank the management and administrative staff at PSMFC and IDFG. In particular, Stan Allen, Braden Butters, George Nandor, Amy Roberts, Matt Robertson, and Tiffany Vandecoevering (PSMFC); Gary Byrne, Jerome Hanson, Paul Kline, and Ed Schriever (IDFG) were instrumental in the daily function of this program. I would also like to thank Paul Abbott and Stuart Rosenburger (IPC); Chris Starr and Steve Yundt (retired)(LSRCP); Dave Knutzen, Scott Molitor, and Brian Toews, Northwest Marine Technology (NMT) for the valuable services that they provide to the program.

The staff at the Nampa Research Facility (IDFG) also deserves a great deal of recognition for their ongoing efforts to improve communication and increase the efficiency of fish-marking in Idaho. Namely Forrest Bohlen, Brian Leth, Chris Sullivan, and Chuck Warren worked well to ensure that the goals of the Mark Plan were met while maintaining a plan that was feasible for the marking crew and respective hatcheries.

I also want to thank the following hatchery managers and their staff, Jerry Chapman and Brian Thompson (IDFG - Niagara Springs Hatchery), Todd Garlie and Morgan Fife (IDFG – Pahsimeroi Hatchery), Craig Eaton and Jarrett Page (USFWS – Hagerman National Hatchery), Chris Jeszke and Steve Kammeyer (IDFG – Magic Valley Hatchery), Anthony Folsom, Malia Gallagher, Bradley George and Chris Shockman (IDFG – Clearwater Hatchery), Jamie Mitchell and Joel Patterson (IDFG – McCall Hatchery), Cassie Sundquist and Phil Koontz (IDFG – Sawtooth Hatchery), Doug Engemann and Brandon Filloon (IDFG–Springfield Hatchery) and Ralph Steiner and Chad Henson (IDFG – Rapid River Hatchery), because without a great deal of communication, assistance, and hard work from you there is no way this program could have been successful. I would like to add a special thank you to the staff at Hagerman National, especially Steve Money, for their continued cooperation in moving the trailers among the three Southern Idaho steelhead facilities.

Mostly, I would like to thank the 2015 Idaho Anadromous Fish-Marking Crew for all the long hours, dedication, and hard work that they put into the marking season to ensure that it was a success. This included many days spent on the road and working irregular shifts and long hours. This truly is a unique program and its success is predicated on the commitment of the fish-marking crew. I want to thank the Trailer Operators – Chad Collier, Mike Friedrich, Matt Hamby, Clint Roby, Chris Root, and Lauren Villalobos (PSMFC) for all their hard work. The Trailer Assistants included Salina Ahknouhk, Cayden Demmick, Travis Hedrick, Mark Inc, Dianna Jones, Summer Meredith, Chris Pike, Lauren Polito, Matt Rodgers, Genevieve Rollins, Jana Vrtelova and Erin Wiese (PSMFC). Finally, a big thank you to our IDFG liaison Michelle Kelley, for all the help and support she provided to the Fish-Marking Program.

## Introduction

In April 2009, IDFG contracted all anadromous fish-marking in the state of Idaho to PSMFC. In 2015, all fish-marking personnel were employees of PSMFC. The marking program was based out of Lewiston, Idaho and consisted of one Tagging Coordinator, six Trailer Operators, four Trailer Assistants, and a varying number of temporary Trailer Assistants as needed for the 2015 marking season. This report summarizes all fish marked by the Idaho Anadromous Fish-Marking Program in the year 2015. The program was responsible for the marking of anadromous fish at the following nine fish hatcheries: Clearwater, Rapid River, McCall, Sawtooth, Springfield, Pahsimeroi, Niagara Springs, Magic Valley, and Hagerman National. While at these fish hatcheries a variety of different marks and tags were applied including adipose fin-clips, coded-wire tags (CWT), and passive integrated transponder (PIT) tags to steelhead (*Oncorhynchus mykiss*), Sockeye salmon (*Oncorhynchus nerka*), and Chinook salmon (*Oncorhynchus tshawytscha*).

The IDFG research division develops a mark plan that indicates the number of fish at each hatchery that are to receive specific marks. Coded-wire tags were implanted from the second week of May through the end of August. The adipose fin-clipping took place from the second week of May through the end of August. PIT-tags were implanted from January through March, and again in November, and provide a unique alphanumeric code to each individual fish.

The overall objectives of the Idaho Anadromous Fish-Marking Program are as follows:

Objective 1: Provide technical and administrative services associated with performing and completing the work identified in the 2015 Fish Marking Contract. Technical and administrative tasks may include: project management, budgeting, scheduling, coordination, crew supervision, report preparation, grant management, invoicing, equipment maintenance and data collection, storage and analysis, and all other tasks that may be necessary to complete the scope of work specified in the 2015 contract.

Objective 2: Purchase supplies as per the contracted budget, hire and supervise project personnel for marking and tagging operations specified in the contract. Operate IDFG owned marking and tagging trailers, vehicles and associated equipment.

Objective 3: Conduct quality control studies for each fin-clipped and coded-wire tagged release group and report to the IDFG Project Manager. Coordinate all project activities and share all project data with IDFG hatchery staff.

Objective 4: Coordinate with IDFG to ensure marking and tagging information is uploaded to IDFG's data storage location. Information will be accurate and timely and conform to the established formatting protocols established by IDFG.

Objective 5: Prepare and submit an annual report to the IDFG Project Manager in electronic form no later than December 31 of the current contract period. Each report shall detail work accomplished, numbers of fish marked and tagged, results of tag retention studies, a discussion of any problems encountered and recommendations to correct challenges or problems encountered during the year. Additionally, PSMFC will provide monthly financial reports as well as preliminary data reports that summarize numbers of fish handled, numbers and types of marks and tags applied, and hatcheries where work was performed.

## Methods

The Idaho marking program used four state-of-the-art automated tagging trailers. Two of these automated trailers have six automated lines, and the other two with five automated lines each. These trailers incorporate the latest advanced technology for adipose fin-clipping and coded-wire tagging fish. These automated trailers have the capacity to mark and implant coded-wire tags very rapidly without the use of anesthetic or human contact. These systems have been in use for many years in the Pacific Northwest and in Idaho since 2002. Steelhead and Chinook salmon were PIT-tagged using a four-station manual PIT-tagging trailer.

The automated trailers are able to process fish that are a minimum of 57mm in total length and a maximum of 142mm in total length. This size restriction means that timing at each facility is critical to maximize efficiency and productivity. At many facilities the fish were processed through the automated trailers when the hatcheries were ready to move the fish from inside rearing vats to outside rearing ponds or raceways, making timing of the mark event even more critical to ensure that the density limits of the inside rearing containers were not exceeded. Double shifts were typically used to maximize efficiency and output of the automated trailers. Trailers were moved as needed between hatcheries relative to fish reaching appropriate marking size.

Fish were delivered to the automated trailers by means of a forklift mounted live fish transfer tank and electric Matsusaka four-inch fish-transfer pumps. The forklifts were operated by hatchery personnel and the fish pumps were operated by members of the fish-marking crew. Once inside the trailers fish were pumped via an internal fish lift system into the sorter. The sorter takes an image of each individual fish and records the total length of the fish (within .1mm) and then diverts the fish to the appropriate line. Each of the automated lines is set up to run a specific size range of fish. Once the fish have reached the automated line they travel down a channel and are separated by a series of gates that ensure one fish at a time arrive at the clamping mechanism. Once the clamps come together on the fish a camera takes an image of the back of the fish and locates the adipose fin. The computer relays the exact X and Y coordinates of the adipose fin in relation to the back of the fish to a clipping mechanism that excises the adipose fin. Once the clipping is complete the camera takes a second image to ensure that the fin-clip was successful. At the moment the clamps come together to hold the fish for imaging the coded-wire tag is inserted into the snout of the fish via a MK IV tag injector that is positioned at the end of each channel. After the fish has been clipped and/or tagged it is released from the clamps and travels through a Quality Control Device (QCD) that checks for the presence of a coded-wire tag. If the fish passes the clip quality check and tag detection, it is then delivered from the trailer to the proper raceway or pond via four-inch discharge pipe. If the fish fails either the tag detection or clip quality check, it is diverted into a reject container and will be processed manually in the back of the trailer by a Trailer Assistant.

In the manual section of the trailer fish that were either too large or too small to be processed through the automated lines, or were rejected by the automated lines, were anesthetized and clipped and/or tagged manually.

At most facilities tag retention studies were conducted to determine the coded-wire tag shed rate for each specific tag code and/or raceway. A minimum of 300 fish were checked 21 days post tagging to check for the presence of a coded-wire tag. Adipose fin clips were also checked on the fish if they had been attempted to be clipped. For the 2015 season, there was a large reduction in the number of

groups of fish that received an adipose fin-clip and coded-wire tag, resulting in not as many groups of fish being checked for adipose-fin clip quality. Due to this the adipose-fin clip quality information for this report is incomplete.

Upon completion of marking operations at each facility all trailers and equipment were disinfected prior to being transported off the hatchery compound following the Idaho Trailer Disinfection Protocol. The first step in this process was to scrub all inside surfaces with diluted liquid Lysol. A large water trough was then used to create a closed water circulating system and a bleach solution (350ppm) was run through the trailer for a minimum of 45 minutes. Upon completion of the disinfection process Sodium Thiosulfate was used to neutralize the bleach and the water was then emptied out of the trailer according to hatchery protocol. Upon arrival at the next facility the entire trailer was extensively flushed with fresh hatchery water before exposing fish to the trailer.

The numbers in this report reflect the fish handled and type of mark that the Idaho Anadromous Fish-Marking Crew applied at each of the respective hatcheries at the time of marking. This information is not intended to be used for release numbers or information regarding release.

## Results

The Marking Program performed the adipose fin-clipping and coded-wire tagging according to the 2015 Mark Plan. A total of 18,546,949 adipose fin-clips (AD) and/or coded wire tag (CWT) marks were applied to 17,307,269 fish in 2015 (Table 1).

**Table 1:** Mark Year 2015 Total number of fish marked, type of mark put on each fish, brood year (BY), and breakdown by each hatchery

HATCHERY	# OF FISH MARKED	AD/CWT	CWT ONLY	AD ONLY	TOTAL MARKS

SPRINGFIELD SOCKEYE BY 2014	544,793	-	-	544,793	544,793
<b>MARK YEAR 2015 TOTALS</b>	<b>17,307,269</b>	<b>1,239,680</b>	<b>1,398,091</b>	<b>14,669,498</b>	<b>18,546,949</b>

Tag retention studies indicated very high rates of tag/mark retention; our program wide goal is to achieve 99% or better tag retention on all groups of tagged fish (Table 2). Adipose fin-clip rates were only checked on those groups of fish that also received a coded-wire tag.

**Table 2:** Mark Year 2015 overall CWT retention rate, Hatchery average, total # of fish with CWT mark, Successful # of CWT marks

## Clearwater Fish Hatchery

### Clearwater Fish Hatchery Spring Chinook

The Idaho Anadromous Fish-Marking Crew processed BY 2014 spring-run Chinook salmon at Clearwater Fish Hatchery on two separate occasions. The first trip occurred May 11<sup>th</sup> through May 15<sup>th</sup> using one five-line automated marking trailer. Fish were loaded in to the trailer using an electric Matsusaka fish-transfer pump. Two six-line and one five-line automated fish marking trailers were used during the second mark event, June 1<sup>st</sup> through June 12<sup>th</sup>. Three electric Matsusaka fish-transfer pumps were used to load the fish into the trailers. A total of 3,505,779 spring-run Chinook salmon were coded-wire tagged and/or adipose fin-clipped during the two trips (Table 4). After marking, fish were distributed to raceways via four-inch aluminum discharge pipe.

### Clearwater Fish Hatchery Summer Chinook

The Idaho Anadromous Fish-Marking Crew processed BY 2014 summer-run Chinook salmon at Clearwater Fish Hatchery. June 1<sup>st</sup> through June 2<sup>nd</sup> of 2015, a total of 244,772 fish were coded-wire tagged or adipose fin-clipped (Table 6). One six-line automated marking trailer was used to process fish that received a coded-wire tag. Fish were loaded into the main trough of the trailer by an electric Matsusaka fish-transfer pump. After marking, fish were distributed to raceways via four-inch aluminum discharge pipe.

## Pahsimeroi Fish Hatchery

The Idaho Anadromous Fish-Marking Crew processed BY 2014 summer-run Chinook salmon at Pahsimeroi Fish Hatchery May 12<sup>th</sup> through May 18<sup>th</sup>. A total of 1,162,583 fish were coded-wire tagged and/or adipose-fin-clipped (Table 10). One five-line and one six-line automated marking trailers were used to process fish that received a coded-wire tag and/or adipose fin-clip. Fish were loaded into the main trough of the two trailers by two electric Matsusaka fish-transfer pumps. After marking, fish were distributed to ponds via four-inch aluminum discharge pipe.

A total of 22,385 BY 2013 summer-run Chinook salmon were PIT-tagged at Pahsimeroi Fish Hatchery March 10<sup>th</sup> using the four-station manual PIT-tagging trailer (Table 11). Fish were loaded into the main trough of the trailer by manually netting the fish out of the pond and transporting them in five-gallon buckets. After marking, fish were distributed back to the ponds via four-inch discharge hose.

## Sawtooth Fish Hatchery

The Idaho Anadromous Fish-Marking Crew processed BY 2014 spring-run Chinook salmon at Sawtooth Fish Hatchery May 21<sup>st</sup> through 26<sup>th</sup> using two six-line automated trailers and one five-line automated trailer. Fish were loaded into the trailers using three electric Matsusaka fish-transfer pumps. A total of 1,814,350 spring-run Chinook salmon were coded-wire tagged and/or adipose fin-clipped (Table 12). After marking, fish were distributed to the raceways via four-inch aluminum discharge pipe.

## Rapid River Fish Hatchery

The Idaho Anadromous Fish-Marking Crew processed BY 2014 spring-run Chinook salmon at Rapid River Fish Hatchery June 15<sup>th</sup> through July 7<sup>th</sup>. A total of 3,260,236 fish were coded-wire tagged and/or adipose fin-clipped (Table 16). Two six-line and one five-line automated marking trailers were used to process fish that received a coded-wire tag and/or adipose fin-clip. Fish were loaded into the main trough of the trailers by two electric Matsusaka fish-transfer pumps. After marking, fish were distributed to the rearing ponds via four-inch aluminum discharge pipe. Due to the long distances between marking trailers and rearing ponds much of the discharge pipe is provided by Rapid River Hatchery and is stored on site at the hatchery.

**Table 16:** Rapid River Fish Hatchery Spring Chinook BY 2014 Raceway Totals and Mark Totals by date, trailer, mark type, tag code, MATS and manual numbers

## McCall Fish Hatchery

The Idaho Anadromous Fish-Marking Crew processed BY 2014 summer-run Chinook salmon at McCall Fish Hatchery on two separate occasions. A total of 1,152,036 fish were coded-wire tagged and/or adipose fin-clipped (Table 18). The first mark event occurred June 15<sup>th</sup> through June 18<sup>th</sup>; one five-line automated marking trailer was used to adipose fin-clip and move fish to outside rearing ponds in order to reduce fish densities in the indoor vats. The second mark event occurred July 6<sup>th</sup> through July 10<sup>th</sup>; one five-line and one six-line automated marking trailers were used to process fish that received an adipose fin-clip and/or coded-wire tag. Fish were loaded into the main trough of the two trailers by two electric Matsusaka fish-transfer pumps. After marking, fish were distributed to ponds via four-inch aluminum discharge pipe.

A total of 53,978 BY 2013 summer-run Chinook salmon were PIT-tagged at McCall Fish Hatchery February 23<sup>rd</sup> through February 25<sup>th</sup> using the four-station manual PIT-tagging trailer (Table 19). Fish were loaded into the main trough of the trailer by an electric Matsusaka fish-transfer pump. After marking, fish were sent back to the pond via four-inch aluminum discharge pipe.

## Magic Valley Fish Hatchery

The Idaho Anadromous Fish-Marking Crew processed BY 2015 summer-run steelhead at Magic Valley Fish Hatchery July 28<sup>th</sup> through August 4<sup>th</sup>. A total of 1,339,401 fish were coded-wire tagged or adipose fin-clipped using one five-line and one six-line automated marking trailers (Table 20). Fish were loaded into the main trough of the two trailers by two electric Matsusaka fish-transfer pumps. After marking, fish were distributed to raceways via four-inch aluminum discharge pipe.

## Hagerman National Fish Hatchery

Photo Credit: Hagerman National Fish Hatchery, USFWS

The Idaho Anadromous Fish-Marking Crew processed BY 2015 summer-run steelhead at Hagerman National Fish Hatchery from August 19<sup>th</sup> through August 26<sup>th</sup>. A total of 1,636,478 fish were coded-wire tagged or adipose fin-clipped using one five-line and two six-line automated marking trailers (Table 22). Fish were loaded into the main trough of one six-line trailer by hatchery personnel utilizing a forklift mounted live fish transfer tank. Fish were loaded into the main trough of one five-line by an electric Matsusaka fish-transfer pump. Fish were loaded into the main trough of one six-line trailer by manually netting the fish out of the tank and transporting them in five-gallon buckets, hatchery personnel utilizing a forklift mounted live fish transfer tank, and an electric Matsusaka fish-transfer pump. After marking, fish were distributed to raceways via four-inch aluminum discharge pipe by all three trailers.

A total of 34,683 BY 2014 summer-run steelhead were PIT-tagged at Hagerman National Fish Hatchery November 4<sup>th</sup> through November 5<sup>th</sup> of 2014, using the four-station manual PIT-tagging trailer (Table 23). Fish were loaded into the main trough of the trailer by hatchery personnel utilizing a forklift mounted live fish transfer tank. After marking, fish were distributed to raceways via four-inch aluminum discharge pipe.

## Niagara Springs Fish Hatchery

The Idaho Anadromous Fish-Marking Crew processed BY 2015 summer-run steelhead at Niagara Springs Fish Hatchery August 8<sup>th</sup> through August 14<sup>th</sup>. A total of 1,888,849 fish were adipose fin-clipped (Table 24). One five-line and two six-line automated marking trailers were used to process fish that received an adipose fin-clip. Fish were loaded into the main trough of the trailers by three electric Matsusaka fish-transfer pumps. After marking, fish were distributed to raceways via four-inch aluminum discharge pipe.

## Discussion

Again in 2015, all trailer transportation requiring a CDL was contracted out to Peters and Keatts Trucking LLC. The only exception to this was that Hagerman National Fish Hatchery employee Steve Money transporting the trailers between the three Southern Idaho steelhead facilities. Peters and Keatts Trucking was once again able to move the trailers in the time frame necessary in order for the program to meet the very strict deadlines that it operates under.

This year the program purchased a third electric Matsusaka fish-transfer pump and a goose-neck trailer to haul all the three fish pumps and associated four inch hoses. This allows the marking crew to be more flexible and/or available to meet all the hatcheries needs and deadlines.

Hagerman National started using an electric Matsusaka fish-transfer pumps for the first time this year in 2015. This process made handling fish easier for the hatchery staff and marking crews. The trailers were also parked in different locations: One trailer was between Hatch House 2 and the upper level raceways; one trailer was between the upper and middle level raceways; and the third trailer was between Hatch House 1 and the lower level raceways. The upper and lower level trailers used the electric Matsusaka fish-transfer pumps and the middle trailer continued using the forklift with transfer tank. There is discussion to put in new power receptacles around the raceways so that the automated trailers could be moved to desired locations throughout the marking process to increase efficiency and productivity.
